Americans are seriously concerned threat of eruption of the supervolcano located in Yellowstone park of the State of Wyoming. According to all available data from researchers, possibility of state of emergency is very high, after all from the park territory animals already run!

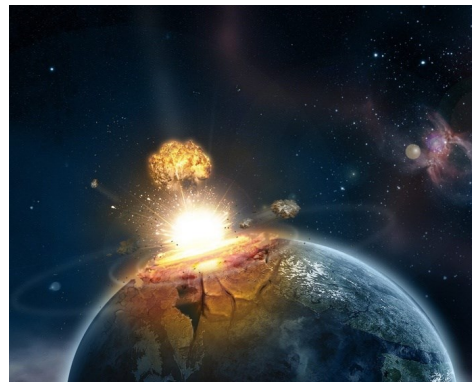

Since March 28 in the territory of the national reserve 25 tremors are recorded already. The strongest - measuring 4,8 points - occurred in the morning on March 30.

The tragedy, was more large-scale which yet on Earth, can occur at any time. In the State park Yellowstone just about can begin a volcanic eruption - magma streams already rage.

Unprecedented activity of crust in this area forces scientists to watch process continuously.

"Old times True"

One of the best-known local sights – a geyser "Old times True" (Old Faithful Geyser). It not the biggest geyser of park, but it enjoys invariable popularity among tourists, because of regular spouting (from here and the name) - to everyone who comes here, majestic show is guaranteed. Time at an o'clock from a subsoil of Earth escapes a stream of boiling water which rises by height of 30-55 meters. Though recently because of earthquakes and vandalism of visitors intervals in geyser work increased a little.
